

NORTHWIND TRADING ANALYSIS

Problem Identification: Qualitative and Quantitative Analysis

Business Analyst: Kaosarat Ibrahim

Date: 6 April 2026

A. Quantitative Analysis

A comparison between February and March sales performance was conducted to understand the decline in revenue.

Metric	Feb-24	Mar-24	Difference	% Change
Total Sales Value	\$71,626.00	\$43,900.00	\$27,726.00	38.71% decrease
Total Number of Transactions	477	323	154	32.29% decrease
Average Daily Sales Value	\$2,558.07	\$1,416.13	\$1,141.94	44.64% decrease
Average Transactions per Day	17	10.4	6.58	38.71% decrease
Average Transaction Value	\$150.16	\$135.91	\$14.25	9.49% decrease

Observations

- Total sales value dropped by 39% in March compared to February. This indicates a significant decline in overall revenue.
- The number of transactions decreased by 32%, meaning fewer purchases were made.

- Average daily sales reduced by 44.6%, showing that each day generated less revenue.
- Average number of transactions per day dropped from 17 to about 10, indicating reduced customer activity.
- Average transaction value decreased slightly by 9.5%, suggesting customers still spent similar amounts per order.

Key Insight

The largest decline was observed in average daily sales, which was mainly driven by the reduction in transactions. This shows that fewer customers completed purchases, rather than customers spending significantly less.

B. Customer Complaints Analysis

Customer feedback was analyzed to identify issues affecting user experience after the website redesign.

Most Common Complaints

Complaint Type	Quantity	Percentage
Checkout Process / Complexity	6	40%
Website Design / Layout	4	26.7%
Mandatory Registration	2	13.3%
Payment Option	1	6.7%
Website Speed	1	6.7%
Product Information	1	6.7%

Findings

- The majority of complaints relate to the checkout process and mandatory registration requirement.

- Customers reported that the checkout process was complex and time consuming.
- Website design and navigation issues made it difficult for users to find products.
- Minor complaints included payment options, website speed, and product information.

Key Insight

Over half of the complaints are related to the new checkout process and mandatory registration, suggesting that these changes negatively affected customer experience and may have reduced completed purchases.

C. Evaluation of Store Manager's Month-End Report

The store manager reported that sales fluctuations were normal and performance remained relatively stable. However, further analysis shows otherwise.

Findings

- Daily sales values fluctuated, but overall monthly performance declined significantly.
- Transactions varied day to day but were lower compared to February.
- The report suggested external factors such as marketing campaigns or seasonality.
- Data analysis indicates that the decline is more closely linked to the new checkout process.

Interpretation

- While daily fluctuations exist, overall sales dropped by 39%, which shows a clear decline.
- Average daily transactions decreased from 17 to about 10, indicating reduced activity.
- The range of values alone does not reflect the severity of the decline compared to February.

Overall Conclusion

The quantitative analysis shows a significant decline in transactions and daily sales performance. Customer complaints highlight issues with the new checkout process and mandatory registration.

These findings suggest that friction introduced during checkout negatively impacted customer experience, leading to fewer completed purchases and reduced revenue.
